

# Redes Neuronales - TP2

## Ej 4

- a - Implemente una red con aprendizaje Backpropagation que aprenda la siguiente función:

$$f(x, y, z) = \sin(x) + \cos(y) + z$$

donde:  $x \in [0, 2\pi]$  y  $y \in [-1, 1]$ . Para ello construya un conjunto de datos de entrenamiento y un conjunto de evaluación. Muestre la evolución del error e entrenamiento y de evaluación en función de las épocas de entrenamiento.

- b - Estudie la evolución de los errores durante el entrenamiento de una red con una capa oculta de 30 neuronas cuando el conjunto de entrenamiento contiene 40 muestras. ¿Qué ocurre si el minibatch tiene tamaño 40? ¿Y si tiene tamaño 1?

Acá la consigna lo lo explicita pero hay que aplicar algo de minibatch al lgoritmo de aprendizaje.

Robando de un post de stackExchange:

batch gradient descent you process the entire training set in one iteration. Whereas, in a mini-batch gradient descent you process a small subset of the training set in each iteration.

Also compare stochastic gradient descent, where you process a single example from the training set in each iteration.

Another way to look at it: they are all examples of the same approach to gradient descent with a batch size of m and a training set of size n. For stochastic gradient descent, m=1. For batch gradient descent, m = n. For mini-batch, m=b and b < n, typically b is small compared to n.

Mini-batch adds the question of determining the right size for b, but finding the right b may greatly improve your results.

Dicho todo esto, la idea es tomar el set de datos y generar batches de entrenamiento. Es otro loop for y una partición de los datos de entrada. hay 2 hiperparams -> la # de minibatches y la # de veces que hacemos el proceso. Para mantener la cantidad de muestras balanceadas, solo se le pueden mostrar 1 vez por batch de minibatch

```
In [1]: import numpy as np
import matplotlib.pyplot as plt
from sklearn.model_selection import train_test_split
```

Vamos a generar las muestras de la función. Voy a barrer X, Y de 0 a 2pi para Z=-1

```
In [2]: x = np.linspace(0,1,num=200)*2*np.pi
y = x # hasta ahora tenemos los ejes
z = [-1,1]
f = []
tripletas_xyz = []

for k in z:
    for i in x:
        for j in y:
            tripletas_xyz.append([i,j,k])

# este es el dataset entero, es gigante.
# -> Lo pasamos a matriz
```

```
dataset = np.asmatrix(tripletas_xyz) # listo.  
  
# no lo shuffleo acá, es lo va a hacer el entrenador  
# voy a generar el f  
  
f = np.sin(dataset[:,0])+np.cos(dataset[:,1])+dataset[:,2]
```

Ahora toca shufflear las filas y hacer dataset de entrenamiento y de testeo. Por comodidad lo hago con sklearn, el resto si será a mano. Como tengo 80mil registros, y quiero batches de números enteros, voy a separar esto en una proporción 70% 30%, que me parece razonable. Luego, los minibatches serán de números como 1,10,100,1000,2000,4000.

```
In [3]: X_train, X_test, y_train, y_test = train_test_split( dataset, f, train_size = 56000, random_state=0)
```

```
